A key topic for the annual IHC conference is how to handle the "Program" which was approved in concept by McMahon. Alison and I will attend and I have offered FBIS to take the lead in defining how we extend our modernized capability to Open Source Community players. FBIS supports all the recommendations (when funded). Most significant are discussed in last three pages of this package.

IHC 1986 Off-site Conference GuidePreface

The principal mission of the DCI's Intelligence Information Handling Committee (IHC) and its permanent staff is to facilitate efficient interchange among Intelligence Community organizations--and between the Community and those it supports--of information necessary to the most effective performance of their missions. While the primary instruments of this endeavor are computer hardware and software, its most critical elements are people and organizations, their perceptions, intentions, and resources with respect to the jobs to be done. The development and operation of automated information handling systems are properly reflections of the latter rather than ends in themselves.

The IHC's 1986 Off-site Conference will seek to implement this recognition in focusing on the Community's near term (roughly the next three years) operational requirements and capability goals in four major areas of concern and endeavor: Community Information Systems, Inter-Community Information Systems, Computer Security, and Open Source Intelligence Support. All have received significant investment, and are scheduled for continued emphasis during the period in view. They are in various ways interrelated, insofar as things done (or not done) in one area will affect one or more of the others. A major objective of the Conference will be to explore such interactions, actual and potential, to see how they might be used to further Community operational interests and programs or, where bullets have to be bitten (as in the case of computer security), to mitigate their impact on operations and resources. Current agency and Community goals in these areas will also be reviewed in the context of specific development programs, ongoing and planned, briefed by their sponsoring organizations. Looking at specific programs and capabilities from the less constrained vantage point of broader requirements and resource availability can yield a different slant on possible development approaches. While no grand strategy is likely to emerge, we will be seeking recognition of opportunities for focused Community action in problem solving and meeting mission performance requirements.

Community Systems

The Intelligence Community has made a very substantial investment in the development of COINS, and proposes to continue its improvement and expansion. At the same time, however, there appears to be insufficient appreciation of the system's capabilities and potential, particularly at senior management levels within the Community. Deployment of system access terminals, the roster of data files maintained, as well as system usage reflect primary orientation toward support of military intelligence production activities and customers.
